## Information

- The test is closed-book.
  - This test has *four* questions, totalling 20 marks.
  - Answer *all* the questions.
  - You have 45 minutes.
  - An information sheet is attached.
-

1. (5 marks) The input  $x[n]$  and output  $y[n]$  of a system are linked by the relation

$$y[n] = T\{x[n]\} = x[-n].$$

Answer the following questions, giving reasons:

- (a) Is the system additive?
- (b) Is the system homogeneous?
- (c) Is the system linear?
- (d) Is the system time invariant?
- (e) Is the system causal?

2. (5 marks) This question deals with convolution and time reversal.

(a) Consider the signals below:

Find  $y[n] = x_1[n] * x_2[n]$ .

(b) Prove the time reversal property for the z-transform: if  $x[n] \xrightarrow{\mathcal{Z}} X(z)$  then  $x[-n] \xrightarrow{\mathcal{Z}} X(1/z)$ .

(c) Suppose  $g[n] = x[n] * x_r[n]$ , where  $x_r[n] = x[-n]$  is the time reversal of  $x[n]$ . Show that  $g[n]$  is symmetric around the origin, or  $g[n] = g[-n]$ .

3. (5 marks) A lowpass filter is described by the following system function:

$$H(z) = \frac{1 - a}{1 - az^{-1}} \quad \text{with ROC } |z| > |a|.$$

- (a) Give an expression for the impulse response of the filter.
- (b) Give an expression for the frequency response of the filter. What requirements are there on  $a$  for this to exist?
- (c) Determine the value of the coefficient  $a$  such that the filter has a  $-3\text{dB}$  cutoff frequency of  $\omega = \pi/4$  radians per sample.

4. (5 marks) The input to an anticausal LTI system is

$$x[n] = u[-n - 1] + (1/2)^n u[n].$$

The Z-transform of the output of the system is

$$Y(z) = \frac{-\frac{1}{2}z^{-1}}{(1 - \frac{1}{2}z^{-1})(1 + z^{-1})}.$$

- (a) Determine the system function  $H(z)$  and specify the ROC.
- (b) Show that the ROC of  $Y(z)$  is  $1/2 < |z| < 1$  and find the time-domain output  $y[n]$ .
